

Join a new generation of women who are realizing the detection and treatment strategy of the past has not stopped the increase in breast disease, which is now developing into an epidemic in the United States.

Medical Infrared Imaging offers the miracle of the "First Glance", the first step in a prevention plan, not only for breast disease, but also for heart, cardio-vascular disease and diabetes.

Take advantage of the earliest possible indications of developing conditions many years before the later stage detection offered by conventional imaging. Medical Infrared Imaging is the best prevention strategy available today!

Safe and painless
No radiation or compression
No referral necessary

What is First Glance?

Inflammation is generally accepted as the earliest stage of degenerative disease. Detection of inflammation requires a heat-sensitive device and is therefore routinely missed by traditional imaging.

First Glance is the earliest possible detection of nearly all degenerative disease.

Medical Infrared Imaging makes First Glance possible, offering the best and possibly the only chance for prevention.

Looking for a way to avoid the breast cancer epidemic?

"First Glance is Your Best Chance"

First Glance

Medical Infrared Imaging

A major development in earlier detection breast imaging.

Can we Avoid a National Epidemic?

The National Cancer Institute estimates that 1 in every 8 American women, which is approx 12,000 out of every 100,000 will be diagnosed with breast cancer in her lifetime. At the same time, Japanese women in Japan have an estimated risk of only 8 in 100,000. Why the big difference? Experts agree that the difference is in our culture and lifestyle. This means, to American women, that there is hope! Breast cancer is a preventable disease!

Our challenge is that all organized efforts are in the detection, not prevention of breast disease. The greatest hope is in the “New Awareness”, which is to:

Medical Infrared Imaging can play a critical role by providing the earliest possible indication of breast health problems, giving a woman and her doctor the advantage of time to evaluate her lifestyle and make positive adjustments. This will give her the best possible opportunity to avoid breast cancer in the future.

Did You Know?

Women whose mothers or sisters had breast cancer are at no particular extra risk of cancer themselves.

Hereditary factors for breast disease are rare (only about 5% of all diagnosed breast cancers), which means that **most breast cancers have little to do with inherited factors.**

This means that American women can change the future of breast disease by monitoring for early signs of trouble and taking action by altering lifestyle factors like diet, chemical and radiation exposures and physical activity.

Medical Infrared Imaging (MII) offers three major benefits to women who wish to monitor the health of their breasts:

1. *Advanced, Risk-Free Imaging*

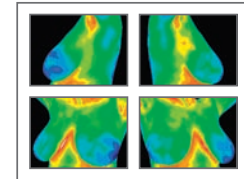

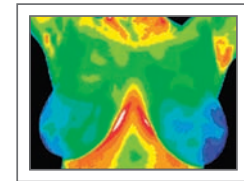

The technician takes a picture that captures the subtle vascular patterns invisible to the human eye without an infrared device, and **no radiation is needed.** The technician can stay in the room with you the entire time. This makes it safe for women of all ages.

2. *Early Detection*

MII can detect the subtle signs that pre-date conventional imaging by 8 or even ten years. We call this “First Glance”. It offers you the advantage of time, the time to make the lifestyle changes that are known to prevent breast disease.

3. *Complete Comfort*

No painful compression of the breasts. MII can actually capture more information by viewing the breasts in their normal, undistorted position. Five views are taken. Some very important benefits are that this position makes it the imaging of choice for women with implants and sensitive breasts.

Images of Healthy Breasts

Because MII offers safety, comfort and early detection, we believe it is truly the “Bright Side of Medical Imaging”
